Security

Your church environment. Secured.

Security and privacy are important to your church. That's why it's important to us. Realm is built from the ground up with industry-standard security protocols put in place so your data is never left out in the open.

Problem to Solve:	Realm eGiving Solution:
Not all churches have the IT budget needed for in-house security of their church database.	In-house server and database management can be a costly solution for any church. However, since Realm is completely web-based, we manage and host all your data in the cloud. Anyone who accesses Realm does so through HTTPS SSL encrypted connections keeping your data is as secure as possible.
Churches need the flexibility and oversight to allow only certain staff members or other leaders to view church data.	In this day and age, your congregation has a right to be wary of how their personal information is accessed by staff or other leaders. Realm was built with the flexibility to provide staff with different levels of access based on their responsibilities in the church. You can easily assign roles to staff or lay leaders and only provide them the access they need without compromising confidential information.
Congregations value the privacy of their personal data and other information.	You don't want to share your information with just anyone; your congregation is no different. That's why Realm allows your congregation the freedom to customize exactly what shows to other non-staff in your church. They can give anyone in the church, just group and serving team leaders, or only those on your church staff rights to see their profile information. They can even further customize their privacy settings for specific information, such as providing their cell phone number to all but not their home address.

Realm Security Advantages:

- Regardless if it's a pastor, a staff member, or a congregant, everyone associated with your church will always access Realm through secure, HTTPS SSL encrypted connections.

- Realm is 100% web-based; there's no need for on-premise servers or workstations that constantly need to be managed or updated. All Realm data is securely placed on our state-of-the-art servers, and all updates are done automatically.

- Providing a secure way to give should be a priority for any church. That's why every online transaction is processed with a PCI Level 1-compliance and backed by the latest industry standards.

Key Features:

- All data - profile, financial information, or otherwise - are behind a password-protected firewall.

- Customize user permissions, such as giving access to add new records but limiting who can view contributions.

- Every congregant has custom privacy settings and can select how and if their contact information is displayed in Realm.

Secure your church data so you can focus on doing ministry with Realm Security.
